THE FOUR LESSONS FROM THE 2015 NEPAL EARTHQUAKE HOUSING RECOVERY

*Link to detailed report [here](#).

*Link to presentation [here](#).

Habitat for Humanity (HfH) and Housing Recovery and Reconstruction Platform (HRRP) jointly organized a webinar on four lessons from the 2015 Nepal Earthquake Housing Recovery prepared by Maggie Stephenson on behalf of HfH Nepal. She presented four potential areas of learning from Nepal's housing recovery efforts and recommended the international humanitarian and reconstruction assistance sector for further attention and improvement on the topics of housing finance, urban recovery, institutionalization and technical assistance (STA) that are exclusively elaborated in the report -whether in Nepal or other post-disaster contexts. The webinar was attended by 144 participants from 15 countries.

The webinar was facilitated by HRRP and had two panelists and two guest speakers:

Panelists:

- Ms. Lena Michaels, Independent Consultant (Independent Impacts and Recovery Monitoring Nepal (IRM) multi year study) and many different studies.
- Mr. Surya Narayan Shrestha, Executive Director, NSET was founded in 1994 and since then NSET has contributed in earthquake risk management, and supporting various disaster response and preparedness programs inside and outside Nepal.

Guest Speaker:

- Mr. Sushil Gyewali, The CEO, National Reconstruction Authority, Nepal

Organizer:

- Mr. Yuban Malla, Program Director, Habitat for Humanity Nepal, Nepal

**Mr. Sushil Gyewali**

CEO

NRA

*Remarks and response to The Four LESSONS FROM THE 2015
NEPAL EARTHQUAKE HOUSING RECOVERY*

I appreciate the work done by Maggie Stephenson and Habitat for the Humanity-Nepal to draw the four key lessons of housing recovery and reconstruction on Housing Finance, Urban Recovery, Institutionalization and Technical Assistance. They have been able to capture the recovery and reconstruction process at large. Additionally, It is important to emphasize how cash distributed through banking channels have increased beneficiaries's access to finance.

The lessons learned shared in this webinar will also support the plan and current efforts by NRA to institutionalize the knowledge, learnings and systems within the appropriate government institutions as per the NRA exit plan.

I acknowledge that the recommendations for the government and development partners presented in these lessons learned are valid and very important. These are valid for recommendations for improvements in the current plan as well as similar post-disaster efforts in the future. I would also request the author to consider the influence of political transition and governance while evaluating the recovery and reconstruction efforts and the current progress. Similarly, it is important to consider the learnings as we progressed from temporary shelter to permanent housing, the visions and challenges with integrated settlement, grievance handling, resource management, relocation and landlessness etc.

Thank you.

**Ms. Maggie Stephenson**

The Author,
The Four LESSONS FROM THE 2015 NEPAL
EARTHQUAKE HOUSING RECOVERY

Ms. Maggie highlighted that catastrophic disasters have the potential to change the systems, by citing the learnings from the natural disasters throughout the world. For eg. The Tsunami of 2004 changed the coordination system, the Haiti Earthquake, 2010 changed the way the organizations approached the urban response, and the Gujarat and Kashmir, 2001 and 2005 earthquake changed the way the management of the cash grant was done in the crises. She also highlighted the imperative that Nepal should write your own story and document it to aid the future researchers. She also provided a brief insight into her report '4 lessons from the Nepal Earthquake Housing Recovery' whereby she discussed the systemic challenges faced by Nepal and how to overcome and build on the improvements.

The document is structured around 4 lessons:

- Housing finance,
- Urban Recovery,
- Institutionalization and
- Technical Assistance.

She pointed out that the cash grants alone are insufficient as a housing financing strategy and it must be supplemented by a strategy to reduce the reconstruction costs and to increase the ability of households to meet those costs. She also urged the government to reuse the existing systems and resources in the future disaster to improve the speed while reducing the costs.

She pointed out that like Haiti and many other disasters, Urban recovery was neglected in Nepal's recovery. Urban recovery takes a long time and requires a coordinated strategy encompassing all the sectors mobilizing the urban expertise and capacity.

She highlighted the importance of institutionalizing the learnings and with the NRA ending and the Disaster Management being handed over to a permanent institution, the challenges are immense. To identify the resources that are to be archived and those to be discarded are important. Another important asset to institutionalize is the people who have a plethora of experience in the recovery and reconstruction. To consolidate learning from reconstruction, it is important to create opportunities at all levels.

She also pointed out the challenges that were faced in the Technical Assistances mainly the gaps in the coverage and equitable distribution of the resources and the possible areas for research, namely time, culture, information, vulnerability and change.

Finally, she also provided the recommendations to the policy makers, partner organizations as well as other stakeholders on finance, urban recovery, institutionalization and technical assistance. She highlighted the need of streamlining the banking processes, introducing broad based strategies in urban recovery, making use of the plethora of knowledge of the NRA engineers in future, and adapting the pool funding mechanisms, and supporting the strategic activities including research and development, and mass communication.

“The HFH document was written quickly and early with very limited access to data, it was never intended to be a comprehensive account. Rather, it was intended to contribute to discussion and point towards the need for a range of more detailed analysis and debate. It was mentioned in the webinar that it only looks at a few topics and it raises more questions than it answers. I hope the document helped to identify gaps that can be covered in the compendium, or issues that need to be more comprehensively addressed in the compendium.”

**Mr. Yuban Malla**

Program Director

Habitat for Humanity - Nepal

Mr. Malla highlighted the impact of COVID-19 and its effect on the ability to work instilling fear and uncertainty. The work from home and restriction has its impacts on many families. A brief introduction into the Habitat for Humanity works in the shelter in 10 districts of Nepal and its commitment in developing safe shelter via innovative housing solution while promoting environmentally sustainable and locally available building materials, capacity building of the locals by working with the local youths and government and microfinance institutions to reach the communities excluded by the existing financial markets. He also shed lights on the methodologies that HFH Nepal adopted during the emergency phase and the way they were able to aid 30,000 families and with the reconstruction activities drawing to a close, he reminded that it is a high time to reflect on the achievements and learnings from the reconstruction activity as a whole so that the whole world would learn from our experiences and also serve the policy makers in taking decisions in the future.

After more than five years of the earthquake, the reconstruction program is almost coming to an end. This has left us with a question on what have we achieved, how, and what could have been done better? Habitat Nepal feels that this can be the right time to ask those questions and document it.

Habitat for Humanity Nepal, with support from Maggie Stephenson, NRA, HRRP, researched lessons from this reconstruction process. Often, we learn, and then we forget, or we miss passing on the learnings to others, which leaves a void. This void break sustainability and pushes the community back again to risk and vulnerability. Hence, we believe that the four key lessons identified by the report and act as a reference

or help us all, including the government of Nepal and communities to institutionalize the learnings and apply in the future, minimizing the risk of losses by such disaster in future. The document tries to simplify the challenges and shortcomings identified during this disaster. It will help us prepare better policies, plans, and programs in the future and identify disaster mitigation as one of the components in every program that we all will implement.

Those lessons indicated by the research may also be helpful for international communities and countries prone to similar kinds of disasters like in Nepal.

**Mr. Surya N. Shrestha**

Executive Director
NSET

Mr. Shrestha commented on the importance of the report and praised it for digging into the lessons learnt from the perspective of how things could be done not only at Nepal, but also at the global level and it adds to the global repository of knowledge. The report, according to him, has identified some of the critical questions on how we did during the recovery. He also emphasized the importance of adding to the global body of knowledge and helping the governments all over the world in dealing with future disasters. The disasters all around the world have contributed to the body of knowledge in some manner, for example: Banda Aceh Tsunami provided the world with the knowledge about coordination mechanism, the Gujarat and Kashmir earthquake added to the body of knowledge about financing mechanisms, and now Nepal needs to add to the global body of knowledge. He suggested that one of the areas that Nepal could contribute is the sustainability area. The housing reconstruction has been done in a compliant manner till date but there is still a challenge of sustaining this compliance and implementing the Building Code at the Rural level. Nepal needs to work on these and show to the global community how the reconstruction and recovery needs to go towards the sustainability phase. He suggested the need of technical and procedural guidance to help the communities to make compliant houses or modify the existing houses in the future. He also highlighted the need to integrate the knowledge into academia via curriculums in the colleges, universities and technical schools. Regarding recovery finance, he shed light on the need of micro insurance or insurance to ensure the funding is available for the future disasters.

Finally, he appreciated the document for bringing forth the important lessons learnt and opening the avenues for future research.

**Ms. Lena Michaels**

Independent Researcher

Coordinator of IRM study, The Asia Foundation

Ms. Michaels commented on the report '4 lessons from the Nepal Earthquake Housing Recovery' and pointed out that the report raised important questions and issues crucial to Nepal's reconstruction and recovery. She stated the insufficiency of cash grants alone as the strategy for housing recovery as the most crucial lesson, and that the majority of problems stem from the affordability and access to finance, and often those who don't have access to finance are the vulnerable HHs and the marginalized that are left behind. For them, additional finance other than the housing grant is crucial. The COVID-19 crisis has impacted them further. Citing the IRM research, Lena also pointed out that the insufficiency of the housing grant has forced the HHs to take high interest loans which they are facing difficulty in paying off. She commented the need of additional options to finance along with the housing grant and a clarity in procedures for accessing them as a crucial factor in earthquake reconstruction and the distribution of the cash resources should be done in an equitable manner.

On Urban Reconstruction; she pointed out higher costs, smaller land plots, joint families, adjoining buildings as specific challenges. The issue of urban poor, who are living in a miserable condition is another major challenge in urban reconstruction. She pointed out that urban reconstruction should be done in a manner preserving the urban heritages as well, and thus needs a customized and holistic settlement approach, encompassing the entire community and a wide range of stakeholders.

She emphasized the importance of documenting, learning, transferring, and institutionalizing the knowledge gained. It transcends through the government actions into the learnings at societal and individual level, documenting those knowledges

and applying them. She also pointed out the several other areas that could serve as a starting point for future researchers.

Mr. Sushil Gyewali
CEO
NRA

1. Housing Finance

Cash distributed through banking channel increased beneficiaries' access to finance.

The distribution of the housing cash grant through banking channel has created access of finance at community level additionally the process motivated the banks and financial institutions to show their presence in rural parts of country. The Cash distribution through the banking system not only ensured transparency and regular cash flow, but it provided financial access at community level in the long run.

We are hearing the different serious issues and corruption-related news even during the distribution of social security funds at the community level, but in the reconstruction process we have distributed more than USD 2 billion with zero financial misuse which is achieved by mobilizing financial institutions during cash distribution. We agree that there are a few questions arising regarding the construction process, but NRA has set good examples on the financial management part not only within our government system but also at the international level.

Flat analysis that everyone has taken loans is not applicable in all cases, so a deep study is required to analyze the cost of reconstruction and source of loans.

People are taking loans from different financial institutions and using revolving funds in some cases, but we don't have actual figures of households who have taken loans and the primary source of loans. Flat analysis that everyone is under debt is not applicable in all cases, so an in-depth study is required to analyze the cost of reconstruction and its source. Identifying the investments of own resources utilized (manpower/finance) by an individual household, the use of government distributed grants, and loans taken for construction could be compared with total investment of the construction and form the key indicator to get actual cost of construction for individual households.

We have the information of each household like housing typology, and the model structure followed by individual households in our MIS. Now, we need to generate information on the total cost of construction by using all the information compared with the standard rate of construction per square feet.

Affordable house construction: House construction is depending upon the psychology and choice of people, how they perceive the technology that you are providing to them.

From the beginning of the reconstruction process, NRA has been working to make new construction more affordable and acceptable by people. We have published design catalogs volume I and II by introducing different technologies of structure, which covers different types of affordable structures. Mainly, design catalog volume II has covered people's need for affordable housing structure which is published after catalog I this is one mistake. Catalog II should have been published first to motivate and encourage people to construct traditional structures. There was no structural design and analysis done of our traditional structures before the Gorkha earthquake. The NRA has conducted test of stone and mud structures in China with the support from NSET to check its resilience, which took some time. Lack of technological and material innovation during building construction in our country is the primary challenge seen in the reconstruction process.

House construction also depends upon the psychological factor of people, how they perceive about the technology that you are providing to them.

Almost 98% of SMC structures (traditional houses) were completely affected by the earthquake, and on the other hand only RCC structures were left behind with minor damage. People are interested in RCC structures and don't believe that SMC structures are also earthquake resilient structures. Also, during discussions at the parliamentary committee, politicians enforce that sand, and mud structures are not safer and that we need to demotivate people to construct such structures. Social and political mindset plays a great role for the design and implementation of structures at the community level.

2. Urban Recovery

Earthquakes had badly affected most of the rural areas of Nepal and as well in urban cities including Kathmandu valley. At the initial stages, our focus was on rural construction and all the guidelines and decisions the NRA had made focused on rural housing reconstruction, so there was a lack of focus and priority from our side as well. As the urban reconstruction process is a complex one, it requires a different approach, which is not achieved by the same

methods used in the rural housing recovery process.

Land issue

Nepal has its own typical land issues compared to other countries, cities like Kathmandu have large scale of land issues (example: Guthi land).

Multiple ownership

Mostly in urban areas, old traditional structures were damaged in core city areas and those houses have multiple ownership. Multiple ownership is another big challenge in urban recovery and due to unwillingness of few owners because of financial and other issues, the reconstruction process is still lagging. The NRA support grant is not enough for the reconstruction and individual households need a big investment from their side, so maybe they are waiting for financial management as well.

Mainly in core urban areas, new housing planning standards are not applicable. They need special procedures for urban reconstruction that is their municipality's own system for construction.

Urban reconstruction needs integrated planning and integrated development approach

Urban housing reconstruction process is not only the reconstruction of a single house, it requires Integrated planning. Urban recovery includes development of other infrastructure like roads, drinking water supply, and drainage supply. Without implementing all these essential factors, only single house reconstruction doesn't meet urban reconstruction requirements. To achieve all this simultaneously, integrated planning and integrated development approach is of key importance. Owner-driven projects are suitable and function well in rural housing recovery, but in case of urban reconstruction other approaches are also necessary besides owner-driven housing approach. To achieve urban sustainable recovery, the government needs to run other infrastructure development projects in parallel with the reconstruction process.

Five years period is not enough for urban recovery

In core urban areas mainly, traditional buildings were affected by the earthquake. Reconstruction of the same traditional old structures will take more time, all urban housing recovery related issues cannot be covered or complete within 5 years. We have multiple complexities in urban recovery and reconstruction, such as land issues (legal and complex land distribution), integrated planning and infrastructure development and the existing

financial model- the situation that only three lakhs is not sufficient for housing construction. We need to go through each complexity and meet the target, which takes more time to achieve. Urban recovery and reconstruction usually takes more than ten years, and therefore development partners should envision the same timeline while designing programs for urban recovery.

Limitation of budget for urban recovery

NRA has already started traditional integrated city planning and other works at few core urban cities like Sakhu, Bungamati, Khokana areas. We need more resources for other infrastructure development of urban cities, but we are not able to implement our planning because of limitations of budget. The Nepal government has already invested a huge amount of its budget on housing reconstruction grants and because of implementation of federalism, the government in this stage can't separate funds for urban recovery. Donors and development partners are also not providing extra budget for urban recovery; however, we have requested for Indian support grants to work on traditional settlements of Bungamati, Khokana and other areas but those funds are also uncertain. Infrastructure development is very important and requires a huge budget; we are expecting financial support on this.

Urban Regeneration Plan

NRA is developing an urban regeneration plan; we have submitted master planning of 6 traditional settlements for further process. For the proper implementation of 6 traditional settlements reconstruction we need a minimum two more years after NRA's timeline. The 5-key components of the urban regeneration plan are:

1. Model – we are clear about urban regeneration models but lacking on implementation.
2. Conservation of monuments.
3. Reconstruction in its own original model (traditional model). Extra 50,000 NRs support has been provided for individual households.
4. Footpath, drainage, electricity wires, drinking water supply and other infrastructure development, which requires a huge amount of budget.
5. Tourism facilities – facilities required for tourist areas like parks, information centers and other valuable components.
6. Livelihood for local communities.

Progress and our further steps

With limited human resources and in the absence of local representatives at local level, there was a lack of proactive planning and implementation during the initial phase. With all

these challenges and complexity, we have around 50% progress on urban recovery which is satisfactory progress. Although we are running with limited time, resources constraints, budget management and limited preparation time, urban recovery and reconstruction program is in our topmost priorities. Monuments preservation and reconstruction process is in progress, and we have also prepared a master plan for the preservation of monuments.

Conclusion

Urban recovery process, its dimensions and complexities are different in various countries and its modality fully depends upon overall governance structure. Now, NRA is focusing on urban recovery but with the limited time and absence of donors and development partners in urban recovery, we are facing challenges to implement this process. After the NRA, the best way forward would be mobilizing local level for coordination and implementation of urban reconstruction and urban regeneration process, and the urban ministry in the central government should coordinate and monitor the process.

3. Institutionalization

The National Reconstruction Authority (NRA) was aware about the institutionalization and importance of sustainable institutional memory from the beginning of the reconstruction process. The NRA was well informed that Nepal's political dynamics were going to change from unitary to federal system through the local election. With the consideration of the potential transformation, NRA has defined the organizational structure and working modality accordingly. In the context, where there were no VDC secretaries, NRA didn't process the grant agreement from other district authorities but chose to create the local ownership through signing of the grant agreement from VDC level by bringing the VDC secretaries from other departments. This was all done with the planning to empower the stable local government from the federal election with a localization approach, which is now proved as successful.

All the reconstruction works were implemented through the line ministry and department rather than the direct implementation from NRA, considering the transfer of the institutional memory. NRA have delegated the authority and finance to a special department under these line ministries which are called Central Level Program Implementation Unit (CLPIU). NRA have used the same existing human resource under ministries and provided regular guidance and monitoring support. Due to which, today, all the Human Resources (HR) within the implementation unit are Nepal's Government human resources and all the working mechanisms are ministries mechanisms. There is no transitional risk during the handover

process as those HR will take back and carry over the remaining reconstruction work and execute it successfully. This is the key essence of the institutionalization process of the overall reconstruction work.

National Disaster Risk Reduction and Management Authority (NDRRMA) was established for the long-term approach and NRA already started working with NDRRMA. Even the disaster management funding from the World Bank allocated for NRA was handed over to NDRRMA to strengthen its establishment and to hand over the institutional memory before the transition process. The NRA formed the district level coordination committee where all the political leaders, government and public stakeholders were involved in the coordination and to facilitate solutions at the local level. All the different stakeholders were involved in the decision-making and this has been a great success as the institutionalization process, where all the stakeholders involved will carry the institutional memory to their organizations. Engineers were trained as the large-scale human capital and now they have gained the knowledge and experience to work with local government and people besides the technical expertise. Masons were trained and all the communities were empowered with model houses. Very good MIS was developed which is in process to hand over to NDRRMA and the local government. The documentation process has already started in five themes to preserve the institutional memory and will be shared through international conferences.

- Compendium of all the experience and to document the process;
- Institutional Paper to capture the varieties of experiences and achievements;
- Scientific Paper;
- Open-ended paper. We are all working together to document this, and the documentation will be owned by everyone.

4. Technical Assistance

The four lessons report highlighted that financial assistance was consistent and evenly distributed to all but Socio-Technical Assistance (STA) was not provided with a blanket approach. Different donors and I/NGOs committed to provide the STA, NRA support in mapping the coverage and resolving gaps. The donor and I/NGOs have designed the STA program for 1-2 years, but the housing reconstruction has continued beyond this period and there was the need, but most of the programs were closed and this created a gap. NRA got dependent on partner organizations whereas STA were provided only for a short period of time. Then, with WB funding, NRA has deployed the social mobilizers and mobile masons on the field, which was delayed for some time. We need to study and map the TA support provided along with its timeframe and the gap analysis. Through STA, 100,000 masons were

trained, and more than 3,500 technical staff were deployed by NRA for the monitoring, inspection as well as to provide TA support which was evenly distributed and was well indicated in their TOR. Some good examples of TA were the community mobilization approach of JICA and NSET, where good ranges of TA were provided by partners but there were some narrow gaps.

Water Sanitation and Hygiene was part of the reconstruction process and during inspection we have assessed that a minimum house should have 120 sq. feet including energy and toilets. The NRA couldn't support rural electrification, which will be covered by the government regular program. Ninety five percent of the people have access to basic water supply and all the Water Sanitation and Hygiene WASH related work were covered by the Department of Water Supply and Sanitation. One of the aspects of rural culture is that the water and toilets are never kept inside the house like in urban areas, which we should also consider.

Coordination of Lessons Learned: Documenting of Lessons learned as per NRA plan with five approaches and strengthening NDRRMA by involving them in the process. Through NDRRMA, province and local wings all the lessons, knowledge and systems to be handed over including the information management system and tie up engineers in the local level to support building bylaws and building code implementation and change in curriculum with mason roster to be available at municipal level.

Knowledge Management: Dis-engagement strategy or exit strategy was prepared by the newly formed task team. What to be handed over to which entity along with the budget and resource mapping, according to which we will implement the handover. The long-term strategy and action plan were prepared by the NDRRMA and the human resource will be transferred to the NDRRMA or province disaster management wings.

ANNEX A: QUESTIONS AND ANSWERS (Q&A)

Q: You said that Nepal's reconstruction was not slow. I agree. Initially (almost 2 years) it was a bit disappointing. There were certain known reasons for that from the support point of view. There must also be some time required to the victims to be settled down for reconstruction. Could you please share your experience from other countries, whether the victims also needed some time or not? If yes, for how long? 1 year, 2 years or more?

A:

NRA CEO: *It depends; if we compare Nepal's reconstruction process with other countries then it will be injustice to Nepal and Nepalese people. We have been through the political transition from unitary to federal system without the proper constitution. During the earthquake period, all the political parties came together to bring the constitution, and NRA could not be established due to the state of interim constitution and the preparation took time. After that all three-level elections were held followed by the economic blockade at the border. Geographical setting was very harsh for reconstruction as there is only 3-4 months building season where the rest of the time is either very cold or rainy. There is no transportation system, no networks, no banking system, no electricity, no local representatives, and fifty percent local offices didn't have staff. With all these challenges we can't compare our reconstruction process to other countries and by keeping all these challenges together, we have done reconstruction in fast track. Resource scarcity was the huge challenge for Nepal's reconstruction process where some donor commitment was conditional and not flexible to use as per geographical need or other requirements. We have not received the full pledge amount from the international commitments and most of them were received very late.*

Maggie: *There isn't an exact answer to the question. The information on the length of the recovery and reconstruction is hard to find due to the gaps in documentation so it is important for us to document the timeline on when the decisions are made and how long it took for communities to reconstruct. The reconstruction depends on several factors throughout the world such as the building seasons, simplicity of logistics and hence is different in different countries. For eg. In Muzaffarabad, although the city has grown a lot, temporary shelters are still there 15 years later and about 40% of the earthquake affected have completed reconstruction. I could share some tables of time it took in detail if you want. Fast or slow reconstruction is a subjective issue for eg. The earthquake-affected people in Bhaktapur or Sankhu might have reconstructed and settled elsewhere but the site itself hasn't been reconstructed yet. There might be complex underlying issues. Also, the access to finance plays a crucial role which affects the reconstruction pace just as much as the NRA*

policy. It is the job of the humanitarian community in tracking those left behind and those unable to reconstruct

Q: We had continued support to vulnerable beneficiaries from the beginning of the Earthquake response to recovery. What are the lessons we have learnt to prioritize the support to vulnerable beneficiaries to ensure no one has been left behind?

A:

Lena: *Many vulnerable groups have benefited from the financial assistance particularly from the non-governmental organizations, but the issue is that it has been uneven and there are many vulnerable HHs who have not received the assistance, and for whom the government top up grant of Rs. 50000 in addition to the housing grant still is not enough. The issue of vulnerability is broader; it's not simply about specific groups such as single women or elderly but it's perhaps more systemic and it's very much about economic resources and whether one has the economic resources to rebuild or not and if one doesn't, what could help? We need to optimize the options for them that could be by working with the construction sector to reduce the cost or by providing access to the low interest loans. The question of vulnerability is a question more about how we can integrate the issues of the vulnerability from the beginning rather than at the end. It is what's happening now.*

Q: How can the lessons and experiences from reconstruction be adopted to contribute to long term resilience after NRA and NDRRMA?

A:

Surya: *We have a couple of organizations already such as NDRRMA, 753 local governments, 7 provincial governments, and several other line ministries and departments, and the lessons of these several aspects of reconstruction must go into these institutions. For this to happen, rigorous discussions and planning must happen under the leadership of two institutions: The NDRRMA and the NRA. It is high time to initiate the discussion because it must be reflected in the institutional systems, mechanisms and the policies of the government. Big part of the discussion should be happening at the parliament involving the parliamentarians who have the responsibility to understand it and integrate into the system.*

Q: Do you also think that the private sectors could have been engaged from very early to promote the reconstruction as well as retrofitting? What were the lessons regarding the role of the private sector in this reconstruction and retrofitting process?

A:

Maggie: *Yes. Both technical private sectors including the engineering community and other*

private sectors for e.g. the media as well. The local radios were already involved but mass communication could have been used better. We cannot undermine the contribution of the private sector. For eg. The Banking sector and the material producers and suppliers. The question is where they could have been guided or leveraged for more impact. We need to understand their viewpoint as well on what could have been done better. The mechanisms of funding are not matched to engage the private sector and the expertise of the people who have the funding are not necessarily to engage the private sector. Too many organizations even with the large budgets go directly down to the community level and draw a line around the project area. When the scale is large, there are bound to be gaps. Engaging the private sector could help bridge those gaps in coverage.

Q: What can we learn from the limited access to affordable housing finance through the housing recovery process? What role can the leading GON institutions as well as the partners do to improve the access to interest free loans?

A:

Lena: *Interest-free loans haven't been widely available because of some reluctance from the banking sector and it's very difficult to implement in the future but I think it's a crucial question to look at why exactly did this not happen and how it may be still be made available now or in the future disasters help in the banking system be more engaged through and what can the government do to reassure the banking sector or to support the banking sector to make these loans available. We heard that in the earthquake during the time of the 1980s apparently interest free loans were made available then by the government. So especially in those areas in Okhaldhunga and other districts each person was sure that they were going to get interest-free loans and they immediately started rebuilding even before getting the housing grant and taking huge loans from local money lenders at high interest rates as they were told that they would get the interest free loans. I think we shouldn't underestimate how many people expected these loans to come soon but unfortunately haven't received them. We must open up the discussion as to why this hasn't happened.*

Q: Is it a systematic organizational change that is needed for urban recovery? Will you be able to expand on this recommendation of organizations and humanitarian actors?

A:

Surya: *I think this has been slightly touched upon in the report also by Maggie. I think yes, we must have longer-term sustainable institutional systems for looking after urban recovery and reconstruction because the urban process is very complicated. There are so many complexities related to land issues, financing and together with that in Nepal and particularly in Kathmandu valley related to the conservation of heritage settlements. That's why it took*

some time for Nepal/for us to make certain decisions on policy related matters. In some of the policy related matters Nepal has already made decisions, but those decisions need to be implemented, and regarding some of the policy aspects there is no answer yet. So, that's why it's a long process, and NRA's term— and in most of the reconstruction as we see— Maggie cleared that the duration is less than 5 years. But mostly 5 years is not enough. That's why whenever an institution like NRA's term completes, there has to be some other institution that should take over longer-term responsibility of urban recovery. So, it requires a lot of intense discussion on what that institution could be, whether it is our ongoing institutions or whether we need to have a different entity/institution for taking over that role. We need to have intense discussion on that.

Q: In the lesson learnt from the introduction of fixed building types and gap in communication that led to some level of loss of vernacular structure. How can we improve on this next time?

A:

Maggie: *There is no simple answer to this. The Repair retrofit was not anticipated or prioritized in the early phase of recovery . Building designs are prepared by the governments in every country and they become the issues of designs or standards. The issue with communication is another aspect. There are a lot of these practical issues and patterns that are again lessons for us. We would need to go to the ground level to understand what's happening and interact with the people why they chose what they chose. We need to understand from the bottom-up perspective as well. It is a large piece of research to do.*

Surya: *This question has been raised in several other reconstruction as well. It is related to how you communicate too. Policy wise it is clear that the people can construct any kind of house that complies with the building code and provisions related to safety. The fixed building type design catalogs are not the only available technical solutions and required building standards. These are the initial efforts made to provide technical solutions to communities but we often use these designs as the only available solutions. There is often a communication gap between the technical assistance provider and the communities. That's another area, I would like to highlight but it requires a lot of research.*

Lena: *I think what we now see is that people are happy with safety but it's not adequate. That goes back to two of Maggie's lessons. One is: Access to finance and another one is the technical assistance and perception that people have to build two room houses. The professionals could and should have given appropriate advice to the beneficiaries on how to*

rebuild.

Q: Who are the target group for these lessons? What is the strategy to ensure that these lessons are absorbed by the target groups?

A:

Maggie:

The target group

The main target group is development partners, meaning donors, development banks, bilateral agencies, UN and regional Organisations involved in coordination, policy and institutional support, NGOs and implementing agencies. This is the humanitarian or development system that mobilizes to support governments and communities affected by disaster.

Development partners are aware that some of the challenges they faced in Nepal and elsewhere were due to the disaster or underlying poverty, but many of the challenges were due to the way the system works. We need to try identifying those systemic issues and address them.

These lessons are aimed not only at the agencies and personnel involved directly in Nepal, but also their regional and headquarter policy and programming personnel.

The second target group is the Government in Nepal, and wider Nepali public and civil society, to reflect on the 2015 earthquake recovery in relation to other disasters elsewhere.

The third target group is all those involved in documenting the recovery, whether participants, academia or media, to assign questions and topics that could contribute to continued learning.

The strategy

This is a small piece of writing but there are much larger efforts underway by the Government of Nepal and by key development partners in Nepal through lesson learning initiatives to record what happened and to bring that learning to the appropriate forums.

The development partners owe Nepal but they also have responsibility in the next country and next disaster to pass knowledge on not just what has gone well, but what you should have done differently, and what needs to happen to make that possible.

So, I have 3 suggestions

- *Don't only write about the successes. You won't improve if you say everything is fine.*
- *Identify practical rather than vague aspirational changes, from people involved at all levels of implementation. They are real measurable changes.*
- *Be strategic and selective, you can't communicate everything, you can't change everything, what are the 3 or 4 key things to change and lessons to learn.*

Q: Please highlight major learnings from Nepal Earthquake Housing Reconstruction compared to other international earthquake reconstruction programs, with some examples.

A:

Maggie: *This document does not aim to evaluate the Nepal earthquake housing reconstruction programme or to compare the results with other international reconstruction programmes. But it does mention cases of similar experiences, repeat patterns of policies and programmes and institutional issues which have arisen before and are therefore not unique to Nepal.*

The document and the 4 lessons in particular, tries to show how lessons learnt from Nepal demonstrates these repeated patterns and can also help us to understand them better- why they happen, what are the consequences and what solutions might be there to address them.

Some of these issues were described in the report. Two in particular have arisen in Nepal and reveal weaknesses in the recovery system that needs to be addressed in future disasters:

a. Urban housing recovery takes time, needs technical capacity and involves a wide range of stakeholders

Examples to illustrate these issues can be found in 1) Bhuj Gujarat, 2) Aceh Indonesia, 3) Kobe Japan, 4) Christchurch New Zealand, 5) New Orleans USA. 6) Bam Iran. All of these wide range of cases show that:

- *Urban housing reconstruction takes 10 years or more, and longer than rural housing reconstruction in the same disasters.*
- *Urban housing reconstruction is more expensive, technically, legally and socially complex.*

- *It needs large numbers of planners, architects, social scientists as well as technical expertise.*
- *Local or municipal authorities have key roles to play but need higher level support and increased capacity. They also need to engage strongly with communities.*

b. In very large scale disasters, the number and range of development partners and funds increases but support is uneven and there are gaps.

Examples to illustrate these issues include: 1) The Philippines, Typhoon Haiyan, 2) Haiti 2010 earthquake. An example of good coverage and use of resources include 3) Pakistan 2005 earthquake. All of these cases show that:

- *Government needs to set out a plan early to mobilize and steer resources.*
- *Development partners need to be willing to coordinate and take collective responsibility*
- *If equity and reaching everyone is an explicit objective, it is more likely to be planned for and achieved. If it is not planned for -it will not happen.*

Q: Are these lessons sufficient, how do you think other lessons and experiences should be documented and coordinated in the coming days of reconstruction time frame?

A:

Maggie: *This document is only a short contribution to the discussions around learning. It is not exhaustive. There could easily be 20 draft lessons for discussion, but 4 were prioritised to be manageable.*

The next round of lessons ‘learned initiatives after previous disasters’ may also be useful to direct readers to source material on other cases as well as to look at what was involved in documentation and learning.

I can't write or tell people 'a lesson' and expect things to happen just because it is read. People need to at least discuss, but ideally also do the learning themselves, to find their own evidence, explanations, reasoning, understanding and solutions to act on it.

Learning is like dieting or getting/ keeping fit. You can get help and advice, including from experienced or expert people, but you cannot outsource it. It takes time and effort by individuals themselves, agencies themselves, government departments themselves, to achieve learning results.

But it may help to have encouragement, examples or tools, and ideas on the table for many people who are undertaking the task for the first time.

The 4 lessons learned document tries to provide ideas to think about or respond to. The lessons learned after the previous disasters document provides examples or tools for how to go about documentation and learning.

The aim for Nepal should not be just documents as outputs, but to work towards practical outcomes in order for Nepal to be equipped to complete recovery in the next phase, to be better prepared for future disaster recovery and to build a resilient housing sector. The aim for development partners should likewise not only be document outputs, but improved systems to support recovery.

Lastly, in answer to the question of what 'should' happen, I think it is extremely important to ensure the recovery continues to be monitored over a longer time frame, at least another decade, as it is still ongoing and many impacts will take time to see or understand.

Lena: *The more lessons are identified and internalized, the better. The HFH lessons focus on international actors and for other places. In Nepal, it is important to also identify lesson 'from Nepal for Nepal'. This could mean collecting, compiling and analysing the experiences of all stakeholders and developing a plan for future disaster preparedness and responses. What has been learned? What should be done differently after the next disaster, and how? The more specific the lessons are, the better, because they can provide a more precise roadmap for how to move ahead. In addition, wider learning in society is important too, which the HFH document also mentions.*

Q: How can livelihood opportunities & economic development programs contribute to urban housing reconstruction and access to housing finance?

A:

Lena: *Yes, they can and should. We have seen that those struggling the most, primarily do so for financial reasons – especially once administrative or logistical hurdles have been*

overcome. Five years after the earthquakes, significant shares of households still struggle to recover financially from the earthquakes and due to the high costs of reconstruction they have gone into debt. Generally, rural economies are moving away from agriculture towards a cash economy. With most rural farmers and urban poor having few options other than migrating for foreign employment, livelihood schemes could significantly help people earn stable incomes and recover. However, a word of caution may be necessary: Many livelihoods schemes have had limited impacts or even failed. Livelihoods support needs to be carefully considered and implemented in coordination with communities.

Q: On Housing financing , lessons from the beneficiary perspective have significant meaning. Beneficiaries have quite a few grievances and suggestions on the financing of this kind. I hope in the report, it is covered as 'lesson from beneficiary perspective' or any form.

A:

Maggie: I am not sure which grievances you refer to, but I can try to answer the question. My short piece on housing finance did not focus on household perspectives which can be better documented by others.

The report does suggest there are lessons to learn from the implementation of the cash grant in Nepal that was relatively complex and burdensome for households. Hopefully in future the mechanisms can be streamlined. It seems important to remember that the 2015 grant mechanism was a first and very large scale. It was not an easy task and challenges were to be expected. I also noted that effective communication needs to be ensured to make people clear about government beneficiaries eligibility terms and conditions. Insufficient communication can contribute to stress and frustration.

Identifying how cash grants can be improved for households, for the government and for financial service providers and trying to introduce practical changes in future would be very helpful. Each perspective needs to be documented and analyzed to make them actionable. Stakeholders working closely with households since the 2015 earthquake may help consolidate household experiences and perspectives and advocate for their suggestions.

To streamline processes for the future, I suggest looking at emergency cash grants along with reconstruction cash grants together with livelihood or other social safety net cash grants in Nepal to address shortcomings and grievances.

Q: Prepositioning of banks for future cash grant distribution (in case of disaster) can be part of a rural municipality Disaster Management Strategy, and banks should open a counter/office within RM (to be very accessible).

A:

Lena: Yes, we have seen that better access to banks has helped housing grant beneficiaries. It is difficult for people in remote areas to repeatedly travel to district headquarters or other administrative centers for documents and accessing loans. The more localized banking systems are, the quicker they can be accessed by people. In this disaster response, people have generally received the full amounts of the housing grant through the banks. In the future, if distribution is localized, there should be mechanisms to ensure people get information about their rights and the amounts of cash grants provided to avoid potential mismanagement or corruption at local levels. However, as these can be easily implemented, the benefits of localized banking offices seem to outweigh the risks.

In addition, other financial services should be engaged early on to ensure access beyond grants, such as local cooperatives. And controls of interest rates charged by moneylenders and microfinance institutions may be needed.

Q: Prepositioning of banks for future cash grant distribution (in case of disaster) can be part of a Rural Municipality Disaster Management Strategy, and banks should open a counter/office within Rural Municipality (to be very accessible)

A:

Maggie: I noted that transfer from temporary reconstruction authorities to permanent disaster management authorities has proven difficult in several other countries and Nepal should expect some of the same challenges. Nepal is in a good position considering the policy and technical foundations already in place before the earthquake and that there is a good overlap in timing between the NDRRMA and NRA.

However, institutionalization should include line ministries such as MOUD, the Ministry of Education etc. who all had critical roles to play in recovery. While NDRRMA has a focal role, they cannot take all responsibility, and all other authorities cannot leave it to NDRRMA. I understand and agree with the emphasis on sustainability that Surya referred to in the webinar, including strengthening building code compliance and regulation of the built environment.

But I would like to highlight that among the lessons to learn and institutionalize from 2015 are

lessons about how to manage a crisis and recovery: how to mobilize capacity, how to plan, how to revise plans, who plays what role, how is information managed, how are resources allocated. Nepal has gained significant experience in all these aspects and has opportunities to use the lessons of success and failures to establish agreements and protocols for future disasters.

Q: By forcefully imposing ready-made design typology, irrespective of local topography, culture, climate, the post-earthquake housing reconstruction has not only destroyed the vernacular architecture and local built form but in most cases the newly built houses have been used for storage or as animal shed. Failure in this singular important issue has diluted the other good aspects of the reconstruction process. This is my conclusion based on critical review of housing reconstruction in Dolakha, Kavrepalanchowk, Sindhupalchowk and Ramechhap districts. Can you please elaborate on this issue?

A:

Maggie: *I don't think housing recovery outcomes are only due to one factor. I think you are suggesting that in Nepal it was solely or primarily due to the official policies/ standards, though you also seem to suggest that the way policies/standards were communicated was also critical.*

In my experience, there are several factors which may have affected why people built what they did, and why they didn't rebuild in vernacular technologies or typologies. These include official policies but also socio-cultural changes within households and communities themselves.

Factors include:

- The official standards may not have adequately incorporated local technologies.*
- Local buildings may have had vulnerabilities which needed technical analysis and appropriate solutions to mitigate those vulnerabilities or positive attributes which needed analysis to ensure their conservation and regeneration. Such research and associated policy work may not have happened, or not in time.*
- The official standards may not have been adequately understood or communicated by the inspectors or by socio technical support actors. The local buildings may not have been well understood by the same actors.*
- The time frame for reconstruction, including deadlines for inspection and cash grants or concern about getting a durable house built may have affected decisions about what*

to build.

- *The materials and the construction skills for vernacular building may not have been easily available or affordable, or as accessible as new alternatives.*
- *The affected households may not have had the resources or access to resources to reconstruct vernacular buildings.*
- *The affected households may intend to continue living in damaged or repaired older buildings or to build at a later stage and have only constructed a minimal building to comply with the grant conditions.*
- *Households may have different performance criteria and aspirations for their new homes, particularly as household structures change and livelihood practices change. New materials may be seen as modern, safe or low maintenance. Old typologies may be seen as obsolete for modern lifestyles, including ceiling heights, fodder storage, joint family accommodation. New typologies may be seen as more appropriate. Investment in electrical, water and sanitation facilities or interior finishes may be a greater priority than cultural conservation, even where tourist accommodation is a factor.*
- *Changes may have already started before the earthquake and been accelerated with the opportunity and need to rebuild. For example, were local new houses built in the decade before the earthquake in vernacular technologies and typologies and if not, why not.*

Accounts which you have undertaken and that capture the changes are very useful, but I would caution against a simple cause and effect conclusion. The question is not evaluative 'did the reconstruction policies destroy culture?', but a more open ended and exploratory 'why did people build different houses?' looking at the choices they felt they had and decisions they made. This information can help us to understand better what happened and is still happening and whether other options and actions could be supported.

In plans for recovery, plans for 'culture' and experts concerned with culture usually focus on monuments, reflecting the built heritage that has protected status in normal times. The cultural heritage that housing and settlements constitute does not get adequate attention in normal times or in recovery. Cultural heritage loss is usually not only due to the disaster directly but is often accelerated or exacerbated during reconstruction when damaged buildings are not repaired but demolished or repaired inappropriately.

The overriding criteria in plans for recovery tends to be safety, which is understandable after deaths, injuries and loss of assets. But safety alone is insufficient to guide housing decisions,

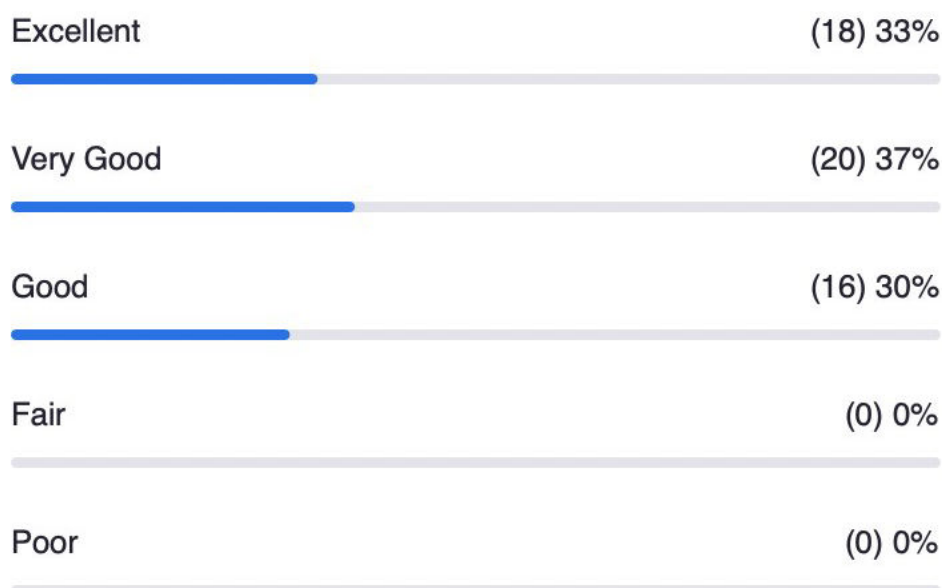

housing standards and policies and socio technical support. Affordability, environmental performance and sustainability, cultural appropriateness and conservation are also vital criteria to meet in a successful housing recovery.

Since Nepal recovery is still underway in rural areas and has a long way to go into urban areas, I suggest there is still time to adjust the criteria, to balance safety with other concerns including culture. The rich built heritage of Nepal including earthquake affected villages and historic towns is of national and international significance and warrants renewed efforts and investment to ensure it is not lost but valued and reinterpreted for future generations.

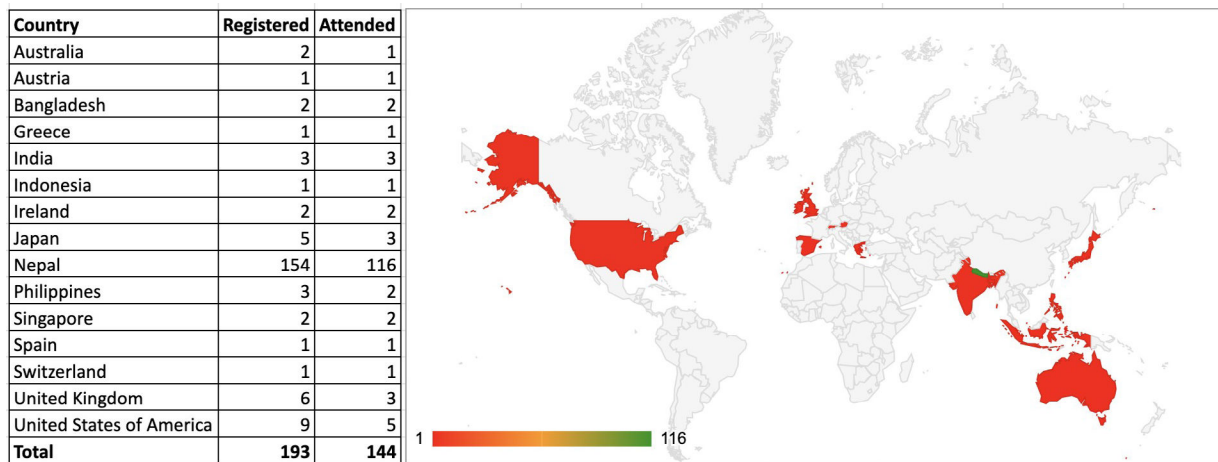

Lena: *Yes, we have observed the same in the IRM research. The designs were often understood to be prescriptive and very many people built them according to the designs for two-room houses instead of according to their needs because they thought they had to in order to receive the housing grant. Now, we can see that people largely consider their new houses inadequate and have continued using their old houses too, or their shelters, or even use the new houses for livestock and storage. This puts the overall success of reconstruction into question. It also raises questions about the safety of housing in the future with many still using old houses or planning to expand their 'earthquake houses' in the future, not necessarily following building guidelines for earthquake-resistant building.*

ANNEX B: POLL RESULTS (SESSION EVALUATION)

1. Overall, how would you rate the event?
